In the ordered graphite structure, domains are found separated by dislocations. Results are described of measurements with a low-temperature scanning tunneling microscope (LTSTM), intended to study surface phenomena below 8 K. Owing to the low operating temperature, measurements can be made with very low drift.

We describe the design of a low-temperature scanning tunneling microscope (LT-STM) head with an integrated piezoelectric coarse approach mechanism. The friction-based motor is tested at room-temperature, and the friction-level is optimized to allow the device to operate reliably at peak voltages down to  $\pm 110$  V.

The design of a low-temperature scanning tunneling microscope is described. The microscope can be operated in ultrahigh vacuum in the temperature range between 15 and 300 K. The main features are a scanner which is based on the Besocke "beetle" design principle combined with a spring suspension of the microscope and complete surrounding of the whole microscope by a 4 K radiation ...

Quantum tunneling increases the probability of penetrating this barrier. Though this probability is still low, the extremely large number of nuclei in the core of a star is sufficient to sustain a steady fusion reaction for millions, billions, or even trillions of years – a precondition for the evolution of life in insolation habitable zones.

A scanning tunneling microscope (STM) is an instrument for imaging surfaces at the atomic level. Its development in 1981 earned its inventors, Gerd Binnig and Heinrich Rohrer (at IBM Zürich), the Nobel Prize in Physics in 1986. For an STM, good resolution is considered to be 0.1 nm lateral resolution and 0.01 nm (10 pm) depth resolution. With this resolution, individual atoms within materials ...

Starting with our proven beetle-type STM with highest spectroscopy performance, we have continuously developed this instrument to three different scanning probe systems: a 4 K LT-STM, a combined 4 K LT-STM/AFM, and a 1 ...
