The following diagram gives the steps to solve ratios and direct proportion word problems. Scroll down the page for examples and step by step solutions. Direct Proportions/Variations Two values x and y are directly proportional to each other when the ratio $x : y$ or \dots is a constant (i.e. always remains the same). This would mean that x and y will either increase together or decrease together by an amount that would not change the ratio.

Direct & Inverse Proportions (Indirect Proportions) with ...

2. PROPORTION : The equality of two ratios is called proportion . If a : b = c : d, we write, a : b :: c : d and we say that a, b, c, d are in proportion . Here a and d are called extremes, while b and c are called mean terms. Product of means = Product of extremes. Thus, a : b :: c : d <=> (b x c) = (a x d). 3 .

A good way to work with a ratio is to turn it into a fraction. Be sure to keep the order the same: The first number goes on top of the fraction, and the second number goes on the bottom. You can use a ratio to solve problems by setting up a proportion equation — that is, an equation involving two ratios.

How to Work with Ratios and Proportions - dummies

If three quantities are in continued proportion; show that the ratio of the first to the third is the duplicate ratio of the first to the second. Solution: Let x, y and z be the three quantities which are in continued proportion. Then, $x : y :: y : z \Rightarrow y^2 = xz \dots(1)$ Now, we have to prove that $x : z = x^2 : y^2$ That is we need to prove that ...
